

Forklift Attachment

Forklift Attachments Sacramento - Without forklift attachments, many jobs would be difficult, if not impossible. The wide range of forklift attachments make most jobs not only possible but also safer and quicker. In addition to general forklift training, operators must be properly training for each attachment they intent to use. Many hydraulic and non-hydraulic forklift attachments are available. They offer numerous benefits by decreasing man-power, employee accidents, fuel consumption, damage to stock and time.

Equipment Considerations A forklift attachment can replace an existing forklift attachment or can be added to a forklift that does not already have one. Various considerations need to be taken prior to adding or replacing any forklift attachment. These considerations include the kind of forklift, the machine's capacity, the number of hydraulic functions required to power the attachment's and the type of carriage. Not considering these issues will drastically increase the safety risks associated with operating the machine and its attachments. This can increase risks relating to operator safety, forklift damage, stock damage and more. There are further safety issues to take into consideration which can be discussed in more detail below.

Forklift Rating and Re-Rating Manufacturers give forklifts a lift capacity rating that needs to be considered and adjusted when adding or changing forklift attachments. There are calculators available online from forklift attachment manufacturers to estimate each attachments particular lifting capacity. However, only the forklift manufacturer can provide accurate lifting capacities. The first step before installing any attachment is to get in touch with the authorized local forklift dealer to request that that forklift brand is re-rated accordingly with the attachment. After the manufacturer of the forklift has re-rated the forklift, it should have a new factory authorized specification plate. This new specification plate will replace the original plate and should be installed showing the new rating for the forklift.

Equipment Upgrades When dealing with forklift attachments it is important to note that a forklift's hydraulic function is made up of a valve on the forklift with a lever located close to the operator which provides two passages of pressurized hydraulic oil to power the attachment features. While not all forklift attachments are hydraulic, hydraulic attachments often include more features than the forklift has valves. When this happens, the forklift needs to have one or more valves added. There are several methods of adding a valve. There are many ways to add a forklift valve. Equipment manufacturers make forklift accessories for hose routing and valve placement. Due to the cost of labor and parts required, this process may not be practical. Another possibility is to install a cable reel, solenoid valve and hose to divert oil from an alternate location. However, the operators' view may be compromised due to the cable reels and hose installation. These parts also may be easily damaged by their location. Kits are available that rely on a solenoid valve and certain hoses to transform the reinforced braid to additionally function as an electrical conduit. Since these hoses replace existing forklift hoses, they remain safe from external damage while maintaining clear vision for the operator.

Safety Considerations Proper training must be obtained prior to fitting any forklift attachment. Operators need to be competent with removing, operating and fitting the attachment before using it. Two important safety factors must be considered before the use of any forklift attachment. The nominal load rating will be reduced on the forklift once any attachment is applied. The nominal load rating is computed with a stock fork carriage and forks. However, the actual load rating may be substantially lower. Second, the center of gravity will be affected by the use of any forklift attachment. Obviously, the stability of the forklift is reduced. Since the attachment's weight is prominent in front of the fulcrum point on the forklift, the operator needs to drive the machine as though it is partially loaded even before it is carrying a load. Operators need to travel gently and slowly every time they use an attachment and take extra care while turning. Check the forklift's capacity to ensure that every attachment is listed on the data plate. To maintain safety, special checks need to be completed before using any forklift attachment. The forklift attachment needs to be the right one for the type of forklift being used, appropriate for the load at hand, correctly attached, locked in place and permitted on the data plate of the forklift. List of

Common Forklift Attachments Discover a list of common forklift attachments and how they are utilized below. There are numerous forklift attachments and this list will cover the most popular. Forklift attachments are designed to increase job efficiency for many applications.

SIDESHIFTER: The sideshifter enables the forklift to move laterally for easier load placement without having to reposition the entire machine.

FORK POSITIONERS: Moves the forks together or apart in relation to one another to adjust for various load types.

DIMENSIONING DEVICES: Dimensioning devices offer cargo dimensions to create more warehouse efficiency and better truck and trailer space. This is commonly used with billing systems that record volume.

ROTATOR: A rotator helps to straighten tilted skids and handle custom load requirements and fast unloading. Many attachments include a rotator feature.

ROLL AND BARREL CLAMP: The roll and barrel clamp allows the forklift to grasp rounded loads including barrels. It is outfitted with different pressure settings to facilitate fragile options and often has a rotate function to simplify horizontal and vertical positioning.

CARTON AND MULTIPURPOSE CLAMP: The carton and multipurpose clamp has pressure settings and is used for handling more squared shaped loads. It easily masters boxes, bales and cartons.

POLE ATTACHMENTS: Long, metal pole used in place of forks to lift rolled items such as carpet or linoleum.

SLIP SHEETER OR PUSH-PULL: Allows operator to transport slip sheets by clamping onto slip sheets, as opposed to pallets, and either pulling the slip sheet onto wide and thin metal forks for loading or pushing the slip sheet to unload. Some variations of the attachment are Save, where the slip sheet is removed for reuse, or Standard.

DRUM HANDLER: The drum handler is built for holding drums. It may have arms that encompass the drum for transporting or it may feature a spring-loaded jaw to grip the drum's top lip.

DRUM AND STORAGE BIN TIPPER: The drum and storage bin tipper is designed for easier transport of liquid items or loose materials into bigger containers.

MAN BASKET: The lift platform known as a man basket is designed to transport workers vertically. It is outfitted with brackets and railings to anchor safety harnesses.

TELESCOPIC FORKS: The telescopic forks are used in locations with a two pallet stacking design where one shelf is placed right behind another with no aisle between them.

SCALES: Scales allow forklift operators to weigh their pallets during transport. This increases efficiency by providing simultaneous data and not making the operator travel back and forth to scales. This attachment can be used for operators who bill by weight in legal-for-trade applications.

SINGLE-DOUBLE FORKS: The single-double forks can be used alongside regular lifting tasks. It allows a single pallet or platform to move or two pallets beside each other. Additional attachments can be used and this replaces the need for having a separate specialty unit; thus reducing maintenance and operating costs associated with more than one machine.

SNOW PLOW: Snow plows are used to remove snow and redistribute it; however, this attachment can be used with other loose kinds of material.

SKIPS: Skips facilitate fast and safe removal of waste to the proper waste or skip compactor. Skips are either a bottom-emptying model or a roll-forward type.

BOOMS AND JIBS: Booms and jibs allow forklifts extended reach. They are available to transport deep or highly stacked loads, suspended loads and more. These attachments can be low profile, precision lifting or reach over models to facilitate extended lengths.
